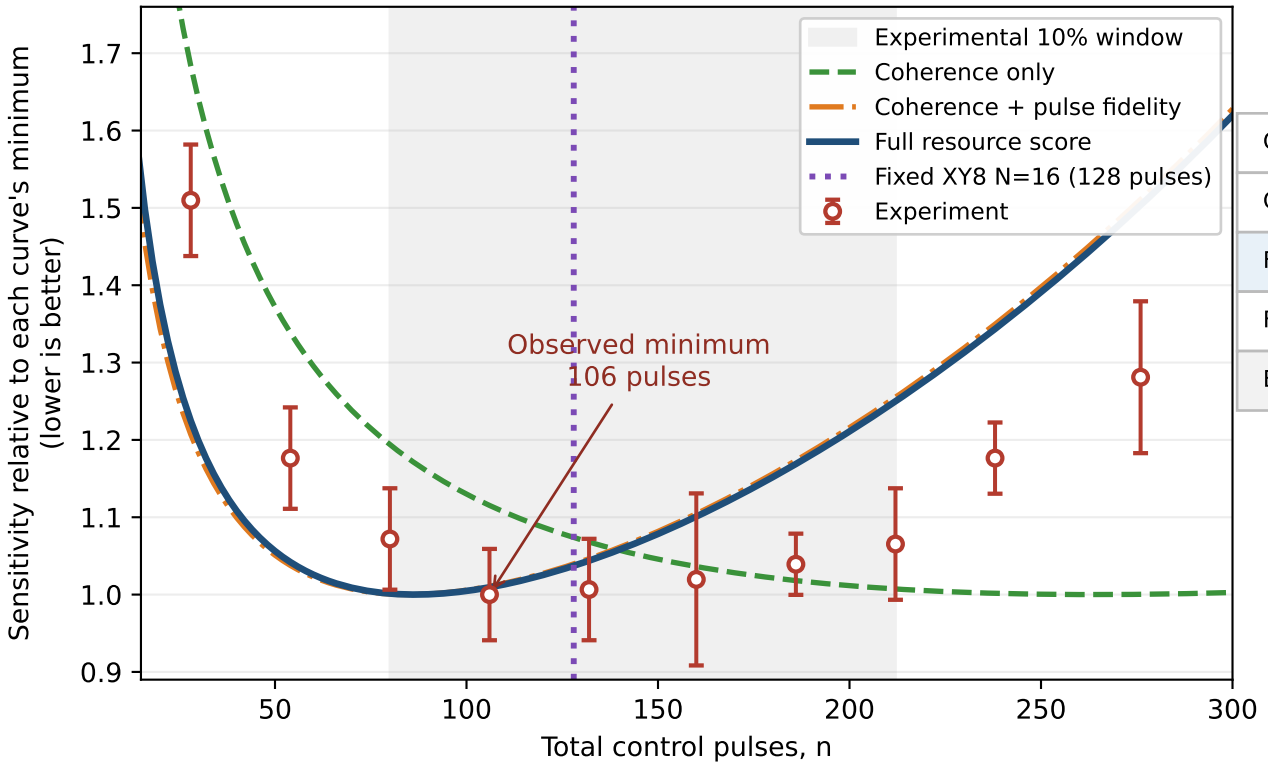
Pulse errors recover the finite optimum, but simpler choices remain competitive

A Nested model comparison



B Decision and shape metrics

	Optimum (pulses)	Error (pulses)	Observed optimum in 10% window	Norm. RMSE	Rank ρ
Coherence only	264	158	No	0.142	0.024
Coherence + Fπ	84	22	Yes	0.162	0.517
Full resource score	86	20	Yes	0.155	0.517
Fixed XY8 N=16	128	22	N/A	N/A	N/A
Experiment	106	0	Reference	0.000	1.000

What improves

Adding pulse fidelity moves the prediction from 264 pulses into the measured finite region.

What remains

Coherence alone has lower RMSE, and fixed N=16 is only 0.55% above the interpolated measured minimum.

Conclusion: pulse fidelity is required to recover a finite optimum; stronger data are needed to distinguish the full score from simpler choices.
