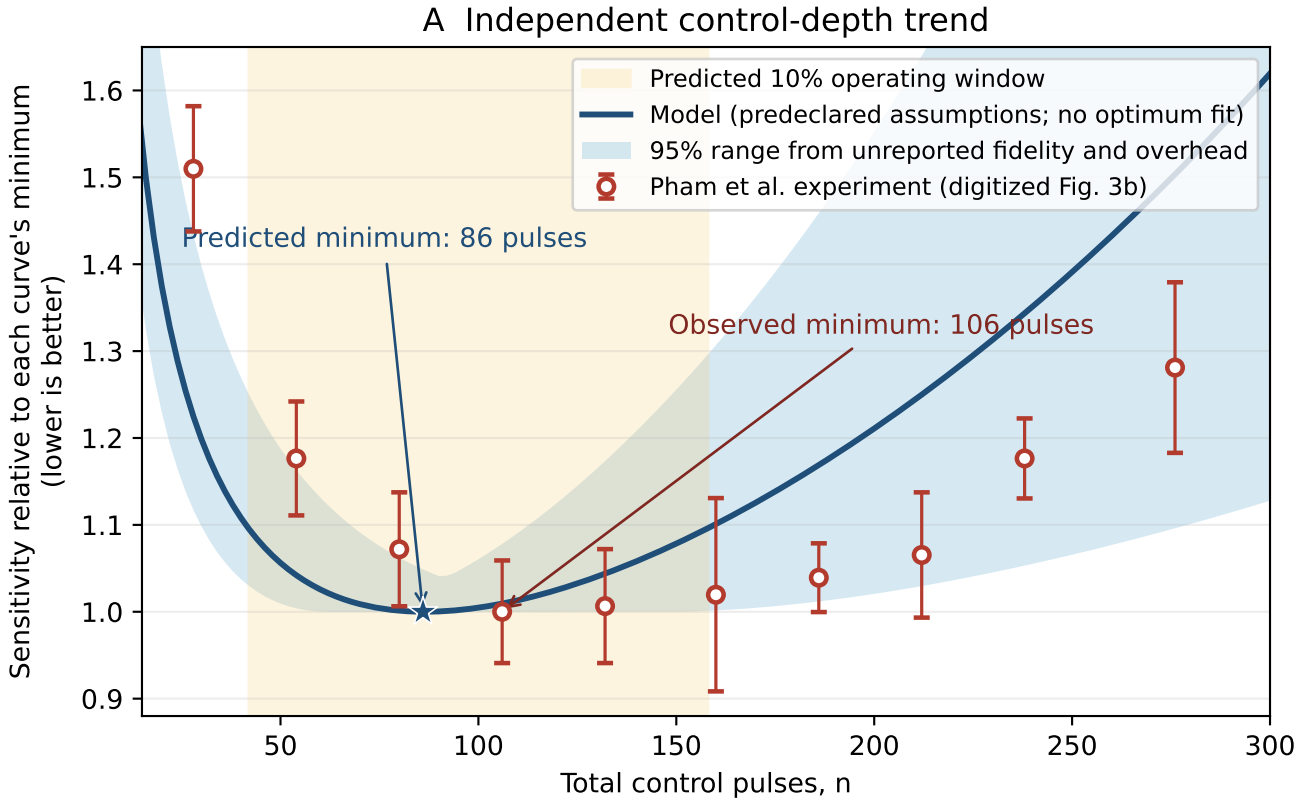
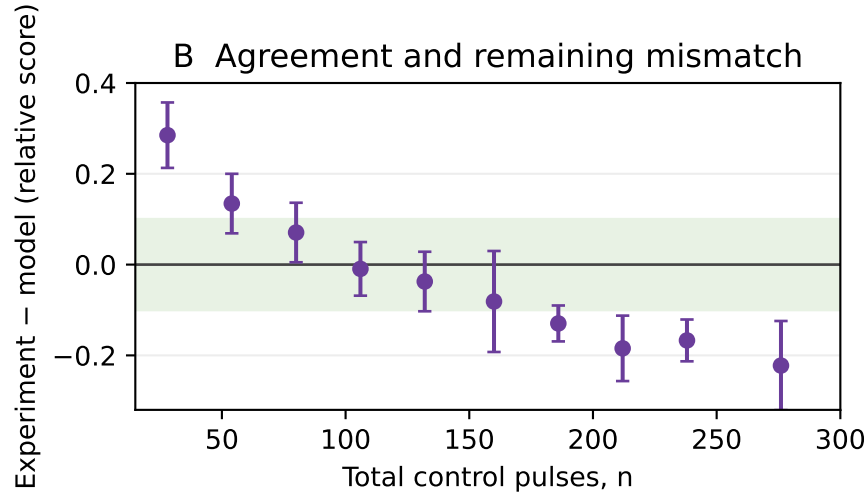
Independent data identify where the model succeeds and where refinement is needed





Reported by holdout paper
f = 84.5 kHz; T_2 = 250 µs; p = 1; s = 0.37

Predeclared, not fitted
Fπ = 0.997; overhead = 7.3 µs

ρ = 0.52; normalized RMSE = 0.16
Observed minimum is inside 42–158 pulse window

The finite-depth trend transfers, but the simple pulse-error term understates the low-depth penalty and overstates part of the high-depth penalty.
